```

Questions:

- What are we testing with the function `ur.df` and why?
- What is the meaning of its parameters?
- What is the regression that was estimated?
- ACF test is based on the assumption of an AR model for the data. Which AR model is considered in this case?
- How is this AR model related to the estimated regression?
- Where does the test statistic come from and why? What is the hypothesis?
- What is the outcome of the test?

```
spectrum(diff(y), kernel="modified.daniell"), log="no")
```

Give an interpretation to the graph above.
